

BENZOXAZEPINE COMPOUND

Technical Field

The present invention relates to a novel benzoxazepine
5 compound having squalene synthase inhibitory activity,
cholesterol lowering activity and triglyceride lowering
activity, which is useful for preventing or treating
hyperlipemia and the like.

10 Background Art

Abnormal increase of the concentration of blood serum
lipids is called hyperlipidemia or hyperlipemia. Blood
serum lipids include cholesterol (cholesterol ester, free
cholesterol), phospholipid (lecithin, sphingomyelin and the
15 like), triglyceride (neutral lipid), free fatty acid, other
sterols and the like, and specifically, the increase of
cholesterol and triglyceride is a clinical issue (COMMON
DISEASE SERIES No.19 hyperlipemia, Haruo Nakamura ed.,
published on October 10, 1991, by Nankodo).

20 Examples of a drug for lowering cholesterol level in
blood include drugs that trap bile acid and inhibit its
absorption such as Cholestyramine and Colestipol (for
example, disclosed in U.S.P. 4,027,009) and drugs that
inhibit acyl coenzyme A cholesterol acyltransferase (ACAT)
25 and suppress intestinal absorption of cholesterol, such as

Melinamide. In addition, drugs that suppress cholesterol biosynthesis, such as Lovastatin (disclosed in U.S.P. 4,231,938), Simvastatin (disclosed in U.S.P. 4,444,784) and Pravastatin (disclosed in U.S.P. 4,346,227) which inhibit
5 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, are used as medicaments.

Furthermore, as triglyceride lowering agents, fibric acid derivatives such as clofibrate (British Patent No. 860303), fenofibrate (German Patent No. 2250327) and the
10 like are used as medicaments.

On the other hand, as compounds having inhibitory effect on biosynthesis of cholesterol by inhibiting squalene synthase are disclosed in non-Patent Publications such as Journal of Medicinal Chemistry, 1988, vol.31, p.1869-1871; Expert Opinion on Therapeutic Patents, 1998, vol.8, p.521-530; Bioorganic Medicinal Chemistry, 2002, vol.10, p.385-400; Bioorganic Medicinal Chemistry, 2002, vol.10, p.401-412; Chemical & Pharmaceutical Bulletin, 2002, vol.50, p.53-58; Chemical & Pharmaceutical Bulletin, 2002, vol.50, p.59-65; Journal of Medicinal Chemistry, 2002, vol.45, p.4571-4580; and Patent Publications such as JP-A 1-213288, JP-A 2-101088, JP-A 2-235820, JP-A 2-235821, JP-A 3-20226, JP-A 3-68591, JP-A 3-148288, JP-A 9-087260, USP 5135935, USP 5726306, USP 5698691, EP 0645377, WO 92/15579,

Disclosure of Invention

It is very important to control the concentration of
5 blood serum lipids properly for preventing or treating
various diseases associated with arteriosclerosis including
ischemic cardiac diseases and cerebral infarction. In
addition, it is thought that hypertriglyceridemia induces
pancreatic disorder. When HMG-CoA reductase is inhibited
10 with a HMG-CoA reductase inhibitor, not only biosynthesis
of cholesterol, but also biosynthesis of other components
essential to living organism such as ubiquinone, dolichol
and heme A are inhibited, resulting in side effects of
concern. In addition, combination use of a triglyceride
15 lowering agent and a statin compound is contraindicated due
to hepatic toxicity. On the other hand, squalene synthase
is an enzyme participating in an essential stage of the
cholesterol biosynthesis pathway. This enzyme catalyzes
reductive dimerization of two molecules of farnesyl
20 pyrophosphate to form squalene.

Under such circumstances, an object of the present
invention is to provide a compound which is safer and has
more potent lipid lowering activity such as squalene
synthase inhibitory activity (cholesterol lowering
25 activity) and triglyceride lowering activity, and thus is

useful as a drug for preventing or treating hyperlipemia.

The present inventors intensively studied and, as a result, for the first time, synthesized a 4,1-benzoxazepine compound characterized by a chemical structure having a particular substituent at the 3-position and found that this compound has unexpectedly excellent pharmaceutical effects such as lipid lowering effect based on its unique chemical structure, has high delivery in transference to a target organ and has a wide safety margin, which resulted in completion of the present invention.

That is, the present invention relates to:

(1) a compound represented by the formula [1]:

wherein ring A and ring B each represent an optionally substituted benzene ring, ring C represents an optionally further substituted aromatic ring, R¹ represents a lower alkyl group optionally substituted with an optionally substituted hydroxyl group, X¹ᵃ represents a bond or

optionally substituted lower alkylene, X^{1b} represents a bond or optionally substituted lower alkylene, X^2 represents a bond, -O- or -S-, X^3 represents a bond or an optionally substituted divalent hydrocarbon group, and Y represents an optionally esterified or amidated carboxyl group, or a salt thereof;

(2) the compound according to the above (1), wherein X^{1b} is a bond and Y is an optionally esterified carboxyl group;

(3) the compound according to the above (1), wherein ring A is a benzene ring substituted with halogen atom(s);

(4) the compound according to the above (1), wherein ring B is a benzene ring substituted with lower alkoxy group(s);

cholesterol level in a mammal, which comprises administering an effective amount of the compound according to the above (1) or a prodrug thereof to said mammal;

(29) use of the compound according to the above (1) or a

5 prodrug for manufacture of a squalene synthase inhibitor;

(30) use of the compound according to the above (1) or a prodrug thereof for manufacture of a triglyceride lowering agent;

(31) use of the compound according to the above (1) or a

10 prodrug thereof for manufacture of a lipid lowering agent;

(32) use of the compound according to the above (1) or a prodrug thereof for manufacture of an agent for preventing or treating hyperlipemia;

(33) use of the compound according to the above (1) or a

15 prodrug thereof for manufacture of a high density

lipoprotein-cholesterol level elevating agent; and the like.

Detailed Explanation of the Invention .

The substituent of the "optionally substituted benzene
20 ring" represented by ring A includes halogen (e.g. fluorine, chlorine, bromine, iodine), an optionally substituted lower alkyl group having 1 to 4 carbon atoms (e.g. methyl, ethyl, propyl, butyl, tert-butyl etc.), an optionally substituted lower alkoxy group having 1 to 4 carbon atoms (e.g. methoxy,
25 ethoxy, propoxy, isopropoxy, butoxy, tert-butoxy etc.), a

hydroxyl group, a nitro group and cyano. The ring A may have 1 to 3, preferably 1 to 2 of these substituents. The adjacent substituents of these substituents may be taken together to form a ring. The substituent of the optionally substituted lower alkyl group having 1 to 4 carbon atoms or the optionally substituted lower alkoxy group having 1 to 4 carbon atoms includes halogen (e.g. fluorine, chlorine, bromine, iodine), and 1 to 3 substituents may be at optional substitutable positions. The ring A is preferably a benzene ring substituted with halogen atoms, etc., more preferably a benzene ring substituted with a chlorine atom. The ring A is preferably a benzene ring represented by the formula:

wherein W represents a halogen atom (e.g. fluorine, chlorine, bromine, iodine) and inter alia, W is preferably a chlorine atom.

The substituent of the "optionally substituted benzene ring" represented by ring B includes the same number of the same groups as those exemplified above as the substituent of the "optionally substituted benzene ring" represented by ring A. The ring B is preferably a benzene ring substituted with a lower alkoxy group having 1 to 4 carbon

atoms, and inter alia, preferably a benzene ring represented by the formula:

wherein R^{2a} and R^{2b} represent independently a hydrogen atom
 5 or a lower alkyl group having 1 to 4 carbon atoms (e.g. methyl, ethyl, propyl, butyl etc.) and particularly preferably R^{2a} and R^{2b} are both methyl groups.

The aromatic ring of the "optionally further substituted aromatic ring" represented by ring C includes
 10 an aromatic hydrocarbon ring and an aromatic heterocyclic ring. The aromatic hydrocarbon ring includes, for example, a benzene ring, a naphthalene ring and the like, and preferred is a benzene ring. The aromatic heterocyclic ring (the aromatic heterocyclic ring of the "optionally
 15 further substituted aromatic heterocyclic ring" represented by ring C') includes, for example, an aromatic heterocyclic ring containing at least one (preferably 1 to 4, more preferably 1 to 2) of 1 to 3 kinds (preferably 1 or 2 kinds) of heteroatoms selected from an oxygen atom, a sulfur atom, a nitrogen atom and the like, as atoms
 20 constituting the ring system (ring atoms).

The aromatic heterocyclic ring includes 5- to 6-membered monocyclic aromatic heterocyclic rings such as furan, thiophene, pyrrole, oxazole, isoxazole, thiazole, isothiazole, imidazole, pyrazole, 1,2,3-oxadiazole, 1,2,4-oxadiazole, 1,3,4-oxadiazole, furazan, 1,2,3-thiadiazole, 1,2,4-thiadiazole, 1,3,4-thiadiazole, 1,2,3-triazole, 1,2,4-triazole, tetrazole, pyridine, pyridazine, pyrimidine, pyrazine, triazine and the like; 8- to 12-membered fused aromatic heterocyclic rings such as benzofuran, isobenzofuran, benzo[b]thiophene, indole, isoindole, 1H-indazole, benzimidazole, benzoxazole, 1,2-benzisoxazole, benzothiazole, benzopyrane, 1,2-benzisothiazole, 1H-benzotriazole, quinoline, isoquinoline, cinnoline, quinazoline, quinoxaline, phthalazine, naphthyridine, purine, pteridine, carbazole, α -carboline, β -carboline, γ -carboline, acridine, phenoxazine, phenothiazine, phenazine, phenoxathiine, thianthrene, phenanthridine, phenanthroline, indolizine, pyrrolo[1,2-b]pyridazine, pyrazolo[1,5-a]pyridine, imidazo[1,2-a]pyridine, imidazo[1,5-a]pyridine, imidazo[1,2-b]pyridazine, imidazo[1,2-a]pyrimidine, 1,2,4-triazolo[4,3-a]pyridine, 1,2,4-triazolo[4,3-b]pyridazine and the like (preferably a heterocyclic ring in which the aforementioned 5- to 6-membered monocyclic aromatic heterocyclic ring is fused with a benzene ring, or a heterocyclic ring in which the same or different two of the

aforementioned 5- to 6-membered monocyclic aromatic heterocyclic rings are fused, more preferably a heterocyclic ring in which the aforementioned 5- to 6-membered monocyclic aromatic heterocyclic ring is fused with a benzene ring) and the like.

The ring C is preferably a monocyclic aromatic heterocyclic ring, a benzene ring or the like, and inter alia, preferred is a 5-membered monocyclic aromatic heterocyclic ring such as pyrazole, imidazole, thiazole, oxazole, isoxazole, 1,2,4-oxadiazole, 1,3,4-oxadiazole or the like.

Although the ring C may be an aromatic ring having a hydrogen atom that may be deprotonated or an aromatic ring having no hydrogen atom that may be deprotonated, an aromatic ring having no hydrogen atom that may be deprotonated is preferred. The aromatic ring having no hydrogen atom that may be deprotonated includes, in addition to an aromatic ring originally having no hydrogen atom that may be deprotonated (e.g. benzene ring, thiazole, oxazole, isoxazole, 1,2,4-oxadiazole, 1,3,4-oxadiazole etc.), an aromatic ring in which a hydrogen atom that may be deprotonated is substituted (e.g. pyrrole, pyrazole, imidazole etc. whose hydrogen atom on the ring-constituting nitrogen atom is substituted or which is bound to X^{1a} or/and X^{1b} via the ring-constituting nitrogen atom).

The substituent, which the aromatic ring of the "optionally further substituted aromatic ring" represented by ring C may have, includes (i) a carboxyl group optionally esterified with an optionally halogenated C₁₋₆ alkyl group or an optionally halogenated C₆₋₁₀ aryl-C₁₋₄ alkyl group (e.g. methyl, ethyl, propyl, isopropyl, butyl, tert-butyl, phenyl, benzyl etc.), (ii) a phosphoric acid group optionally mono- or di-substituted with optionally halogenated C₁₋₆ alkyl (e.g. methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, n-pentyl, isopentyl, neopentyl, hexyl etc.) or C₂₋₇ alkanoyloxy-C₁₋₆ alkyl such as acetoxymethyl or pivaloyloxymethyl, (iii) a sulfonic acid group, (iv) a sulfonamide group optionally substituted with an optionally halogenated C₁₋₆ alkyl group or an optionally halogenated C₆₋₁₀ aryl-C₁₋₄ alkyl group (e.g. methyl, ethyl, propyl, isopropyl, butyl, tert-butyl, benzyl etc.), (v) a hydroxyl group and a sulfhydryl group, which may be optionally substituted with an optionally halogenated C₁₋₃ alkyl group (e.g. methyl, ethyl, propyl etc.), (vi) a carbamoyl group, (vii) a phenyl group optionally substituted with 1 to 5 substituents [e.g. hydroxyl group, chlorine, fluorine, aminosulfonyl group, amino group optionally substituted with C₁₋₃ alkyl group (e.g. methyl, ethyl, propyl etc.)] and optionally bound to the aromatic ring via O or S, (viii) an amino group optionally mono- or

di-substituted with an optionally halogenated C₁₋₃ alkyl group (e.g. methyl, ethyl, propyl etc.), (ix) a cyclic amino group optionally substituted with 1 to 3 C₁₋₃ alkyl (e.g. methyl, ethyl etc.), benzyl, phenyl and the like (e.g. a 5- to 6-membered cyclic amino group optionally containing an oxygen atom or a sulfur atom in addition to nitrogen atoms as ring-constituting atoms, such as a cyclic amino group derived (by removing one hydrogen atom) from cyclic amine such as piperidine, pyrrolidine, morpholine, thiomorpholine, piperazine, 4-methylpiperazine, 4-benzylpiperazine, 4-phenylpiperazine, 1,2,3,4-tetrahydroisoquinoline or phthalimide), (x) a 5- to 6-membered aromatic heterocyclic group containing 1 to 4 heteroatoms selected from N, O and S and optionally bound to the aromatic ring via O or S (e.g. pyridyl, imidazolyl, indolyl, tetrazolyl etc.), (xi) a halogen atom (e.g. chlorine, fluorine, bromine, iodine etc.), (xii) a C₁₋₄ alkyl group (e.g. methyl, ethyl, propyl, isopropyl, butyl, tert-butyl etc.), a C₁₋₄ alkoxy group (e.g. methoxy, ethoxy, propoxy, isopropoxy, butoxy, tert-butoxy etc.) or a C₁₋₄ alkylthio group (e.g. methylthio, ethylthio, propylthio, isopropylthio, butylthio, tert-butylthio etc.), each of which may be optionally substituted with a substituent selected from a halogen atom, a C₁₋₄ alkoxy group, a C₁₋₄ alkylthio group, carboxyl and phenyl, (xiii) a C₅₋₇

cycloalkyl group (e.g. cyclopentyl, cyclohexyl, cycloheptyl etc.), and (xiv) optionally halogenated C₁₋₇ alkanoyloxy (e.g. formyloxy, acetoxy, propionyloxy, butyryloxy, tert-butoxycarbonyloxy, isobutyryloxy, valeryloxy, pivaloyloxy etc.). The "optionally further substituted aromatic ring" may be substituted with 1 to 6, preferably 1 to 3 such substituents at substitutable positions. Two of such substituents may be taken together to form C₃₋₆ alkylene, C₃₋₆ alkyleneoxy, C₃₋₆ alkylenedioxy or the like. For example, when two adjacent substituents on a phenyl group are linked each other to form C₄ alkylene, a tetrahydronaphthyl group is formed.

The lower alkyl group of the "lower alkyl group optionally substituted with an optionally substituted hydroxyl group" represented by R¹ includes, for example, C₁₋₆ alkyl such as methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, n-pentyl, isopentyl, neopentyl, hexyl and the like. Among them, a C₃₋₆ alkyl group is preferred and a C₄₋₅ alkyl group is more preferred. Inter alia, a branched C₄₋₅ alkyl group such as isobutyl, neopentyl or the like is preferred.

The substituent, which the lower alkyl group of the "lower alkyl group optionally substituted with an optionally substituted hydroxyl group" represented by R¹ may have, includes a hydroxyl group optionally substituted

with C₂₋₂₀ alkanoyl or C₁₋₇ alkyl. Such substituent includes, for example, a hydroxyl group, acetyloxy (acetoxy), propionyloxy, tert-butoxycarbonyloxy, palmitoyloxy, dimethylaminoacetyloxy, 2-aminopropionyloxy and the like.

5 The lower alkyl group may be substituted with 1-3 such substituents at substitutable positions.

Examples of R¹ include 1-propyl, 1-isopropyl, 1-isobutyl, 1-neopentyl, 2,2-dimethyl-3-hydroxypropyl, 3-hydroxy-2-hydroxymethyl-2-methylpropyl, 3-acetoxy-2,2-dimethylpropyl, 3-acetoxy-2-hydroxymethyl-2-methyl-propyl, 3-acetoxy-2-acetoxymethyl-2-methylpropyl, [1-(hydroxymethyl)cyclobutyl]methyl and the like. Among them, preferred are 2,2-dimethyl-3-hydroxypropyl, 3-hydroxy-2-hydroxymethyl-2-methylpropyl, 3-acetoxy-2,2-dimethylpropyl, 3-acetoxy-2-hydroxymethyl-2-methylpropyl, 3-acetoxy-2-acetoxymethyl-2-methylpropyl and the like.

The lower alkylene of the "optionally substituted lower alkylene" represented by X^{1a} includes, for example, C₁₋₆ alkylene such as methylene, dimethylene, trimethylene, tetramethylene, pentamethylene, hexamethylene and the like. Among them, preferred is straight chain C₁₋₄ alkylene such as methylene, dimethylene, trimethylene, tetramethylene or the like, and more preferred is straight chain C₁₋₃ alkylene.

The substituent, which the lower alkylene of the "optionally substituted lower alkylene" represented by X^{1a}

may have, includes the same groups as those exemplified above as the substituent, which the aromatic ring of the "optionally further substituted aromatic ring" represented by ring C may have, an oxo group and the like. The "lower
5 alkylene" may be substituted with 1 to 6, preferably 1 to 3 such substituents at substitutable positions.

X^{1a} is preferably a bond or straight chain C_{1-3} alkylene, and particularly preferably methylene.

The lower alkylene of the "optionally substituted
10 lower alkylene" represented by X^{1b} includes the same groups as those exemplified as the lower alkylene of the "optionally substituted lower alkylene" represented by X^{1a} . The substituent, which the lower alkylene of the "optionally substituted lower alkylene" represented by X^{1b}
15 may have, includes the same number of the same groups as those exemplified as the substituent which the lower alkylene of the "optionally substituted lower alkylene" represented by X^{1a} may have.

X^{1b} is preferably a bond or straight chain C_{1-3} alkylene, and particularly preferably a bond.
20

X^2 is preferably a bond.

The "divalent hydrocarbon group" of the "optionally substituted divalent hydrocarbon group" represented by X^3 includes a group formed by removing one hydrogen atom from
25 a hydrocarbon group. The hydrocarbon group includes a C_{1-7}

straight or branched chain alkyl group (e.g. methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, 1,1-dimethylethyl, n-pentyl, 3-methylbutyl, 2-methylbutyl, 1-methylbutyl, 1-ethylpropyl, n-hexyl, 4-methylpentyl, 3-methylpentyl, 2-methylpentyl, 2-ethylbutyl, 1-ethylbutyl, neopentyl, hexyl, heptyl), a C₃₋₇ cycloalkyl group (cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cyclohexylmethyl etc.), a straight or branched chain C₂₋₆ alkenyl group (e.g. vinyl, allyl, isopropenyl, 2-methylallyl, 1-propenyl, 2-methyl-1-propenyl, 2-methyl-2-propenyl, 1-butenyl, 2-butenyl, 3-butenyl, 2-ethyl-1-butenyl, 2-methyl-2-butenyl, 3-methyl-2-butenyl, 1-pentenyl, 2-pentenyl, 3-pentenyl, 4-pentenyl, 4-methyl-3-pentenyl, 1-hexenyl, 2-hexenyl, 3-hexenyl, 4-hexenyl, 5-hexenyl etc.), a C₆₋₁₀ aryl group (e.g. phenyl, naphthyl), a C₇₋₁₄ arylalkyl group (e.g. benzyl, phenethyl, naphthylmethyl) and the like.

The substituent, which the "divalent hydrocarbon group" of the "optionally substituted divalent hydrocarbon group" represented by X³ may have, includes the same group as those exemplified above as the substituent which the lower alkylene of the "optionally substituted lower alkylene" represented by X^{1a} may have, optionally halogenated C₁₋₆ alkylidene (e.g. methylidene, ethylidene, propylidene, isopropylidene, butenylidene etc.), vinylidene, cyclohexylidene, benzylidene and the like. The "divalent

hydrocarbon group" may be substituted with 1 to 6, preferably 1 to 3 such substituents at substitutable positions.

The "divalent hydrocarbon group" of the "optionally substituted divalent hydrocarbon group" represented by X^3 preferably includes (1) straight or branched chain alkylene in which the number of carbon atoms constituting the straight chain part is 1 to 7 (preferably 1 to 4) (e.g. methylene, ethylene, trimethylene, tetramethylene, pentamethylene, hexamethylene, heptamethylene, propylene, ethylmethylene, ethylethylene, propylethylene, butylethylene, methyltetramethylene, methyltrimethylene etc.), (2) a double bond- containing carbon chain in which the number of carbon atoms constituting the straight chain part is 2 to 7 (preferably 2 to 4) (e.g. vinylene, propenylene, butenylene, butadienylene, methylpropenylene, ethylpropenylene, propylpropenylene, methylbutenylene, ethylbutenylene, propylbutenylene, methylbutadienylene, ethylbutadienylene, propylbutadienylene, pentenylene, hexenylene, heptenylene, pentadienylene, hexadienylene, heptadienylene etc.), (3) phenylene (e.g. 1,2-phenylene, 1,3-phenylene, 1,4-phenylene etc.) and (4) a divalent group in which phenylene and alkylene and/or alkenylene are combined (e.g. $-\text{CH}_2-\text{C}_6\text{H}_4-$, $-\text{CH}_2\text{CH}_2-\text{C}_6\text{H}_4-$, $-\text{CH}_2-\text{C}_6\text{H}_4-\text{CH}_2-$ etc.).

X^3 is preferably C_{1-4} alkylene such as methylene,

ethylene, trimethylene, tetramethylene or the like,
vinylene, propenylene, phenylene or the like.

The "optionally esterified or amidated carboxyl group"
represented by Y includes carboxyl, lower alkoxy carbonyl
5 having 2 to 7 carbon atoms (e.g. methoxycarbonyl,
ethoxycarbonyl, propoxycarbonyl, isopropoxycarbonyl,
butoxycarbonyl, tert-butoxycarbonyl, sec-butoxycarbonyl,
pentyloxycarbonyl, isopentyloxycarbonyl,
neopentyloxycarbonyl etc.), C₇₋₁₄ aryloxycarbonyl (e.g.
10 phenoxycarbonyl, 1-naphthoxycarbonyl), C₈₋₁₂
aralkyloxycarbonyl (e.g. benzyloxycarbonyl etc.), carbamoyl,
N-C₁₋₆ alkylcarbamoyl, N,N-diC₁₋₆ alkylcarbamoyl, N-C₈₋₁₂
aralkylcarbamoyl, N,N-diC₈₋₁₂ aralkylcarbamoyl, 1-
pyrrolidinylcarbonyl, piperidinocarbonyl,
15 morpholinocarbonyl and the like. Among them, Y is
preferably carboxyl, methoxycarbonyl, ethoxycarbonyl or the
like, and particularly preferably carboxyl.

The compound represented by the formula [1] includes,
particularly preferably, 3-(2-{3-[(3R,5S)-7-chloro-5-(2,3-
20 dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-2-oxo-
1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]propyl}-1,3-
thiazol-5-yl)propionic acid, 3-(2-{2-[(3R,5S)-7-chloro-5-
(2,3-dimethoxyphenyl)-1-(2,2-dimethylpropyl)-2-oxo-1,2,3,5-
tetrahydro-4,1-benzoxazepin-3-yl]ethyl}-1,3-thiazol-4-
25 yl)propionic acid, (2-{[(3R,5S)-7-chloro-5-(2,3-

The compound represented by the formula [I] may be in
 a free form or a pharmacologically acceptable salt form,
 and both forms are included in the scope of the present
 invention. When the compound represented by the formula
 20 [I] has an acidic group such as a carboxyl group, etc., the
 compound may form a salt with inorganic bases (e.g. alkali
 metal such as sodium, potassium etc., alkaline earth metal
 such as calcium, magnesium etc., transition metal such as
 zinc, iron, copper etc.) or organic bases (e.g. organic
 25 amines such as trimethylamine, triethylamine, pyridine,

picoline, ethanolamine, diethanolamine, triethanolamine, tris(hydroxymethyl)methylamine, dicyclohexylamine, N,N'-dibenzylethylenediamine and t-butylamine, basic amino acids such as arginine, lysine ornithine, and the like).

5 When the compound represented by the formula [I] of the present invention has a basic group such as an amino group or the like, the compound may form a salt with inorganic acids or organic acids (e.g. hydrochloric acid, nitric acid, sulfuric acid, phosphoric acid, carbonic acid, 10 bicarbonic acid, formic acid, acetic acid, propionic acid, trifluoroacetic acid, fumaric acid, oxalic acid, tartaric acid, maleic acid, citric acid, succinic acid, malic acid, methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, etc.) or acidic amino acids such as 15 aspartic acid or glutamic acid.

 The compound represented by the formula [I] or a salt thereof has asymmetric carbon atoms at the 3-position and the 5-position, and may be a mixture of stereoisomers. The 20 isomers may be separated by a known means. Preferred is the trans form in which the substituents at the 3-position and 5-position are directed to the opposite direction each other relative to the plane of the 7-membered ring, and specifically preferred is a compound having the absolute 25 configuration represented by the formula [Ia]. In addition,

the compound represented by the formula [I] or a salt thereof may be a racemic form or an optically active form, and the optically active form can be separated from the racemic form by a known optical resolution means.

5 A prodrug of the compound represented by the formula [I] or a salt thereof refers to a compound which is converted into the compound represented by the formula [I] or a salt thereof by a reaction with an enzyme or gastric acid under the physiological condition in vivo, that is, a
10 compound which is changed into the compound represented by the formula [I] or a salt thereof by enzymatic oxidation, reduction, hydrolysis or the like, or a compound which is changed into the compound represented by the formula [I] or a salt thereof by hydrolysis with gastric acid or the like.
15 The prodrug of the compound represented by the formula [I] or a salt thereof includes, when the compound represented by the formula [I] or a salt thereof has an amino group, a compound whose amino group is acylated, alkylated or phosphorylated (e.g. the compound represented by the
20 formula [I] or a salt thereof whose amino group is eicosanoylated, alanylated, pentylaminocarbonylated, (5-methyl-2-oxo-1,3-dioxolen-4-yl)methoxycarbonylated, tetrahydrofuranylated, pyrrolidylmethylated, pivaloyloxymethylated or tert-butylated, etc.); when the
25 compound represented by the formula [I] or a salt thereof

has a hydroxyl group, a compound whose hydroxyl group is acylated, alkylated, phosphorylated or borated (e.g. a compound whose hydroxyl group is acetylated, palmitoylated, propanoylated, pivaloylated, succinylated, fumarylated, alanylated or dimethylaminomethylcarbonylated, etc.); and when the compound represented by the formula [I] or a salt thereof has a carboxyl group, a compound whose carboxyl group is esterified or amidated (e.g. a compound whose carboxyl group is ethylesterified, phenylesterified, carboxymethylesterified, dimethylaminomethylesterified, pivaloyloxymethylesterified, ethoxycarbonyloxyethylesterified, phthalidylesterified, (5-methyl-2-oxo-1,3-dioxolen-4-yl)methylesterified, cyclohexyloxycarbonylethylesterified or methylamidated, etc.). These prodrugs can be prepared from the compound represented by the formula [I] or a salt thereof by a method known per se.

A prodrug of the compound represented by the formula [I] or a salt thereof may be a compound that is changed into the compound represented by the formula [I] or a salt thereof under the physiological condition as described in Development of Pharmaceutical Products, vol. 7, Molecular Design, 163-198, Hirokawa Shoten (1990).

The compound represented by the formula [I] or a salt thereof may be hydrous or anhydrous.

The compound represented by the formula [I] or a salt thereof may be labeled with an isotope (e.g. ^3H , ^{14}C , ^{35}S , ^{125}I etc.).

The compound represented by the formula [I] or a salt thereof can be prepared, for example, by reacting a
5 compound represented by the formula [II]:

wherein symbols are as defined above, or a derivative thereof with a compound represented by the formula:

10

wherein symbols are as defined above, or a salt thereof according to a method known per se (e.g. "Comprehensive Heterocyclic Chemistry", ed. by A.R.Katritzky and C.W.Rees, vol.4-6, Pergamon Press, Oxford, 1984), or thereafter
15 forming an aromatic heterocyclic ring by cyclization reaction.

A combination of the "functional group involved in an

aromatic heterocyclic ring forming reaction" represented by Z^1 and Z^2 includes, for example:

(1) one is a carboxyl group and the other is 2-aminoalkanoyl group,

5 (2) one is a carboxyl group and the other is hydrazide,

(3) one is a thiocarbamoyl group and the other is an alkanoyl group substituted with a halogen atom at the 2-position, and

10 (4) one is a N-hydroxyamidino group and the other is carboxylic acid halide, or the like.

A method of preparing the compound represented by the formula [I'] includes Process A, Process B and the like, wherein a compound represented by the formula [II'] or a derivative thereof is used as the starting material.

Process A

Process B

wherein, Z^{1a} represents a hydroxyimino group or a sulfur atom, Z^{2a} represents a methylene group or an imino group,

and Z^{2b} represents a halogen atom, or a lower alkyl group in which the carbon atom adjacent to the carbonyl group is substituted with one halogen atom.

In the step 1, a method of preparing the compound represented by the formula [IV] from the compound represented by the formula [II'] or a derivative thereof and the compound represented by the formula [III] includes, for example, a method comprising condensing the compound represented by the formula [II'] and the compound represented by the formula [III] with a generally known dehydration condensing agent in the presence of both compounds simultaneously, a method comprising activating the carboxylic acid of the compound represented by the formula [II'] by a generally known activating method and then reacting it with the compound represented by the formula [III], and a method comprising reacting a derivative of the compound represented by the formula [II'] with the compound represented by the formula [III].

The dehydration condensing agent includes, for example, N,N'-dicyclohexylcarbodiimide, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide, carbonyldiimidazole, 1H-benzotriazol-1-yloxytris(dimethylamino)phosphonium hexafluorophosphate and the like.

A method of activating carboxylic acid includes, for example, a method comprising converting carboxylic acid

into acid anhydride with chloroformate, pivaloyl chloride or the like, a method comprising converting carboxylic acid into acid chloride with oxalyl chloride, thionyl chloride or the like, method comprising esterifying carboxylic acid with 1-hydroxybenzotriazole using a dehydration condensing agent or the like, and the like.

A method of reacting a derivative of the compound represented by the formula [II'] with the compound represented by the formula [III] includes a method comprising heating an ester derivative of the compound represented by the formula [II'] in the presence of the compound represented by the formula [III].

The compound represented by the formula [III] can be prepared, for example, according to Convenient Syntheses of δ -Aminolevulinic Acid, Ayelet Nudelman and Abraham Nudelman, Synthesis 1999, No. 4, pp568-570.

In the step 2, a method of preparing the compound represented by the formula [I] from the compound represented by the formula [IV] includes a method comprising treatment with Lawesson's reagent or phosphorus oxychloride (POCl_3).

In the step 3, a method of preparing the compound represented by the formula [V] from the compound represented by the formula [II'] or a derivative thereof includes, for example:

1) a method of preparing the compound represented by the formula [V] using, as an intermediate, a compound represented by the formula [VIII]:

5 obtained from the compound represented by the formula [II'] by a generally known amidation method;

2) a method of preparing the compound represented by the formula [V] using, as an intermediate, a compound represented by the formula [IX]:

10

wherein X^{1a'} represents an optionally substituted lower alkylene, obtained by a reduction reaction of carboxylic acid or a derivative thereof from the compound represented by the formula [II'] or a derivative thereof;

15

3) a method of preparing the compound represented by

the formula [V] using, as an intermediate, a compound represented by the formula [X]:

obtained by a generally known reduction reaction of
 5 carboxylic acid or a derivative thereof from the compound
 represented by the formula [II'] or a derivative thereof,
 or by a generally known oxidation reaction of alcohol from
 the compound represented by the formula [IX];
 or the like.

10 An amidation method includes a method comprising
 condensation with ammonia or 1-hydroxybenzotriazole ammonia
 (HOBt·NH₃) using a dehydration condensing agent and a
 method comprising preparation of amide represented by the
 formula [XI]:

wherein L¹ represents a protecting group for an amino group, followed by removal of the protecting group for an amino group.

5 A reduction reaction of carboxylic acid or a derivative thereof includes a reduction reaction of carboxylic acid or a derivative of carboxylic acid using a reducing agent such as lithium aluminum hydride, diisobutylaluminum hydride sodium borohydride, or the like.

10 An oxidation reaction of alcohol includes, for example, a method comprising treatment with a sulfur trioxide pyridine complex or oxalyl chloride in dimethyl sulfide, an oxidation method using an oxidizing agent such as pyridinium chlorochromate or Dess-martin reagent, etc. and the like.

15 A method of preparing the compound represented by the formula [V] from the compound represented by the formula [VIII] includes, for example, a method comprising treatment with anhydride such as trifluoromethanesulfonic acid anhydride, a method comprising treatment with a dehydration
20 condensing agent such as carbonyldiimidazole in the presence of allyl bromide and the like.

A method of preparing the compound represented by the formula [V] from the compound represented by the formula [IX] includes, for example, a method comprising conversion
25 of the hydroxyl group into a substitutable group followed

by treatment with cyanide, a method comprising Mitsunobu reaction in the presence of cyanide such as acetone cyanohydrin (a method comprising treatment with an azodicarboxylic acid derivative such as 1,1'-

5 (azodicarbonyl)dipiperidine and an organic phosphorus compound such as tri-n-butylphosphine or triphenylphosphine) and the like.

A method of preparing the compound represented by the formula [V] from the compound represented by the formula
10 [X] includes, for example, a method comprising reaction with an oxidizing agent such as iodine in aqueous ammonia, a method comprising Wittig reaction with phosphoric acid ester containing a cyano group in its molecule such as cyanomethylphosphoric acid diethylester followed by
15 hydrogenation reaction and the like.

In the step 4, a method of preparing the compound represented by the formula [VI] from the compound represented by the formula [V] includes, for example, a method comprising treatment of the compound represented by
20 the formula [V] with dithiophosphoric acid diethylester or the like, a method comprising treatment with hydroxylammonium chloride in the presence of an alkali such as sodium hydrogen carbonate.

In addition, a method of preparing the compound
25 represented by the formula [VI] includes, for example, a

method comprising treatment of the compound represented by the formula [VIII] with a sulfurizing agent such as diphosphorus pentasulfide and the like.

In the step 5, a method of preparing the compound represented by the formula [I] from the compound represented by the formula [VI] and the compound represented by the formula [VII] includes, for example, a method comprising heating the compound represented by the formula [VI] in the presence of the compound represented by the formula [VII] and the like.

Among the compounds represented by the formula [VII], a compound represented by the formula [XII]:

wherein Z^3 represents a lower alkyl group in which it is substituted with a halogen atom on the carbon atom adjacent to the carbonyl group, may be prepared by, for example, Process C or the like.

Process C

wherein Z^4 represents a halogen atom.

In the step 6, a method of preparing the compound represented by the formula [XII] from the compound represented by the formula [XIII] includes, for example, a method comprising a reaction with diazomethane or
5 trimethylsilyldiazomethane in a solution of hydrobromic acid in acetic acid and the like.

In each reaction of the process for preparing the compound [I] or a salt thereof and each reaction for synthesis of the starting compounds described above, when
10 the starting compound has an amino group, a carboxyl group or a hydroxy group as a substituent, such a substituent may be protected with a protecting group which is usually used in peptide chemistry or the like. After reaction, if necessary, the protecting group can be removed to obtain
15 the desired compound.

A protecting group for an amino group includes, for example, formyl, C₁₋₆ alkylcarbonyl (e.g. acetyl, ethylcarbonyl etc.), phenylcarbonyl, C₁₋₆ alkyl-oxycarbonyl (e.g. methoxycarbonyl, ethoxycarbonyl etc.),
20 phenyloxycarbonyl, C₇₋₁₀ aralkyl-carbonyl (e.g. benzylcarbonyl etc.), trityl, phthaloyl, N,N-dimethylaminomethylene and the like, each of which may be optionally substituted. As such a substituent, a halogen atom (e.g. fluorine, chlorine, bromine, iodine etc.), C₁₋₆
25 alkyl-carbonyl (e.g. methylcarbonyl, ethylcarbonyl,

butylcarbonyl etc.), a nitro group or the like is used and the number of substituents is about 1 to 3.

A protecting group for a carboxyl group includes, for example, C₁₋₆ alkyl (e.g. methyl, ethyl, n-propyl, i-propyl, n-butyl, tert-butyl etc.), phenyl, trityl, silyl and the like, each of which may be optionally substituted. As such a substituent, a halogen atom (e.g. fluorine, chlorine, bromine, iodine etc.), formyl, C₁₋₆ alkyl-carbonyl (e.g. acetyl, ethylcarbonyl, butylcarbonyl etc.), a nitro group or the like is used and the number of substituents is about 1 to 3.

A protecting group for a hydroxy group includes, for example, C₁₋₆ alkyl (e.g. methyl, ethyl, n-propyl, i-propyl, n-butyl, tert-butyl etc.), phenyl, C₇₋₁₀ aralkyl (e.g. benzyl etc.), formyl, C₁₋₆ alkyl-carbonyl (e.g. acetyl, ethylcarbonyl etc.), phenyloxycarbonyl, benzoyl, C₇₋₁₀ aralkyl-carbonyl (e.g. benzylcarbonyl etc.), pyranyl, furanyl, silyl and the like, each of which may be optionally substituted. As such a substituent, a halogen atom (e.g. fluorine, chlorine, bromine, iodine etc.), C₁₋₆ alkyl (e.g. methyl, ethyl, n-propyl etc.), phenyl, C₇₋₁₀ aralkyl (e.g. benzyl etc.), a nitro group or the like is used and the number of substituents is about 1 to 4.

A method of removing a protecting group may be a method known per se or the similar method, and for example,

a method comprising treatment with acid, base, reduction, ultraviolet light, hydrazine, phenylhydrazine, sodium N-methyldithiocarbamate, tetrabutylammonium fluoride, palladium acetate or the like is used.

5 In addition, in each reaction of the process for preparing the compound [I] or a salt thereof and each reaction for synthesizing the starting compounds described above, a generally known solvent may be used during the reaction.

10 A generally known solvent includes, for example, ethers such as tetrahydrofuran, diethyl ether, 1,2-dimethoxyethane and 1,4-dioxane; esters such as ethyl acetate and butyl acetate; aromatic hydrocarbons such as benzene and toluene; aromatic heterocyclic compounds such
15 as pyridine and lutidine; amides such as N,N-dimethylformamide and N-methylpyrrolidone; halides such as chloroform and methylene chloride; alcohols such as methanol, ethanol, 2-propanol and 2,2-dimethylethanol; hydrocarbon compounds such as hexane, heptane and petroleum
20 ether; carboxylic acids such as formic acid and acetic acid; water; and the like.

A solvent used in the reaction may be a single solvent or a mixture of 2 to 6 solvents.

The reaction may be also performed in the presence of
25 a base such as amines such as triethylamine, N,N-

diisopropylamine, pyridine or N-methylmorpholine, sodium hydroxide, potassium carbonate or the like.

The reaction may be also performed in the presence of an acid such as hydrochloric acid, sulfuric acid, acetic acid or the like.

The compound represented by the formula [I] or a salt thereof obtained by the above methods can be isolated or purified by a conventional separation means such as recrystallization, distillation, chromatography or the like.

When the compound represented by the formula [I] of the present invention thus obtained is in the free form, it can be converted into a salt form by a method known per se or the similar method (e.g. neutralization, etc.). Conversely, when the compound is obtained as a salt, it can be converted into the free form or another salt by a method known per se or the similar method. When the resulting compound is in the racemic form, it can be separated into the d-form and the l-form by a conventional optical resolution means.

The starting compounds of the compound represented by the formula [I] or a salt thereof may be also in a salt form similar to a salt of the compound represented by the formula [I], but the kind of the salt is not particularly limited as long as the reaction is not disturbed.

The compound represented by the formula [II] or a

derivative thereof can be prepared by, for example, a method described in EPA567026, WO95/21834 (PCT application based on Japanese Patent Application No. 6-15531), EPA645377 (application based on Japanese Patent Application
5 No. 6-229159), EPA645378 (application based on Japanese Patent Application No. 6-229160) or JP-A 9-136880, or the similar method.

Since the compound represented by the formula [I] or a salt or a prodrug thereof (hereinafter sometimes referred
10 to merely as the compound (I), including a salt thereof and a prodrug thereof) is low toxic and has squalene synthase inhibitory activity, LDL cholesterol lowering activity, triglyceride lowering activity, lipid lowering activity, non-HDL cholesterol lowering activity and HDL cholesterol
15 level elevating activity, it is useful as a safe medicament for prevention or treatment of hyperlipemia such as hypercholesterolemia, hypertriglyceridemia or hypoHDLemia in a mammal (e.g., mouse, rat, rabbit, dog, cat, cattle, pig, monkey, human and the like) and is also useful for
20 prevention or treatment of metabolic syndrome. Moreover, the compound is useful as a safe medicament for prevention or treatment of kidney disease such as nephritis or nephropathy, arteriosclerosis, ischemic disease, heart infarction, angina pectoris, heart failure, aneurysm,
25 cerebral arteriosclerosis, cerebral apoplexy, transient

ischemic stroke, brain infarction, peripheral
arteriosclerosis, intermittent claudication, thrombosis,
hypertension, osteoporosis, diabetes (e.g., insulin
resistance-dependent type and the like), diabetic
5 complications (e.g. diabetic nephropathy, diabetic
neuropathy, diabetic retinopathy, diabetic angiopathy and
the like), pancreatic disorder, or restenosis after
percutaneous coronary plasty (PTCA) or stent placement.

Hereinafter the utility of the present invention is
10 explained in detail.

The compound (I) has superior triglyceride lowering
activity and cholesterol lowering activity as well as
biological characteristics thereof, and is specifically
suitable for treatment or prevention of hyperlipemia, in
15 particular hypertriglyceridemia, hyperlipoproteinemia and
hypercholesterolemia, as well as metabolic syndrome and
atherosclerotic vascular lesion arising therefrom and
secondary disease thereof such as coronary artery disease,
cardiac infarction, angina pectoris, brain infarction,
20 brain ischemia, intermittent claudication, peripheral
arteriosclerosis, gangrene and the like.

For treatment of these diseases, the compound (I) may
be used alone or may be used in combination with other drug
ingredients such as a lipid lowering agent, a cholesterol
25 lowering agent, an HDL level elevating agent or a

cholesterol absorption inhibitor (administered simultaneously or administered at a certain interval). In this case, these compounds are preferably administered as oral preparations (including intraoral disintegrating tablets) or they may be optionally administered in the form of suppository as rectal preparations. In this case, possible ingredients for the combination use include, for example, a PPAR_α agonist such as fibrates [e.g., Clofibrate, Benzafibrate, Gemfibrozil, Fenofibrate, Wy-1463, GW9578 and the like]; and a cholesterol lowering agent such as nicotinic acid and a derivative and analogue thereof [e.g., Acipimox and Probucol], a bile acid-binding resin [e.g., Cholestyramine, Colestipol and the like], a compound that suppresses absorption of cholesterol [e.g., Ezetimibe, Sitosterol, Neomycin and the like], a compound that inhibits biosynthesis of cholesterol [e.g., an HMG-CoA reductase inhibitor such as Lovastatin, Simvastatin, Pravastatin, Atorvastatin, ZD-4522 (Rosuvastatin), Itavastatin and the like], a squalene epoxidase inhibitor [e.g., NB-598 and an analogue compound thereof and the like] or an HDL level elevating agent due to inhibition of cholesterol ester-transporting protein [e.g. JTT-705, CP-529-414 and the like]. In addition, a combination with an acyl-Coenzyme A cholesterol acyltransferase (ACAT) inhibitor (e.g. melinamide etc.) or a lipid rich plaque

regressing agent (e.g. compounds described in WO 02/06264, WO 03/059900 etc.) is possible. Further, a combination with a body fat lowering agent such as a pancreatic lipase inhibitor (e.g. orlistat etc.) is also possible.

5 Another possible ingredient for the combination use includes an oxide squalene-lanosterol cyclase inhibitor, for example, a decalin derivative, an azadecalin derivative or an indan derivative.

10 In particular, by combining with an HMG-CoA reductase inhibitor, myalgia and myolysis which are also the side effect of an HMG-CoA reductase inhibitor may be alleviated. Further, this combination not only has lipid lowering activity but also is effective against osteoporosis and Alzheimer's disease, and may improve the prognosis of
15 ischemic disease (cerebral apoplexy, cardiac infarction or the like).

 In addition, the compound (I) is suitable for treatment of disease associated with hyperchylomicronemia, for example, acute pancreatitis. Regarding the mechanism
20 of onset of pancreatitis, it is said that chylomicrons cause microembolization in a pancreatic capillary blood vessel, or hyperchylomicronemia results in increase in production of free fatty acid by digestion of triglyceride with pancreatic lipase and then the free fatty acid
25 stimulates strongly a local place, whereby pancreatitis is

developed. Therefore, since the compound (I) has triglyceride lowering activity, it can treat pancreatitis and it can be used for treating pancreatitis alone or in combination with a known therapy. For treatment of this
5 disease, the compound (I) can be administered orally or topically and it can be used alone or in combination with a known active compound. In this case, ingredients which can be combined include, for example, aprotinin (Trasylol), gabexate mesilate (FOY), nafamostat mesilate (Fusan),
10 citicoline (Nicoline), urinastatin (Miraclid) and the like for anti-enzymatic therapy. For the purpose of alleviation of pain, an anticholinergic agent, a non-narcotic analgesic or a narcotic is also used.

A further notable example of application of the
15 compound (I) is application for secondary hyperlipemia. The disease includes diabetes, hypothyroidism, nephrotic syndrome or chronic renal failure and the like, and hyperlipemia onsets subsequent to these diseases. In many cases, hyperlipemia aggravates these diseases, namely,
20 forms a vicious circle. In view of lipid lowering activity, the compound (I) is also suitable for treatment or prevention of development of these diseases, and in this case, it can be administered alone or in combination with the medicaments listed below.

25 Diabetes treating drugs: Kinedak, Penfil, Humalin,

Euglucon, Glimicron, Daonil, Novolin, Monotard, insulins, Glucobay, Dimelin, Rastinon, bacilcon, Deamelin S, iszilins; insulin sensitizers (thiazolidine and non-thiazolidine PPAR agonists: pioglitazone, Avandia, KRP-297, TAK-559, MCC-555 etc., isoxazolidine drugs: JTT-501 etc.), biguanide drugs (e.g. mitiglinide etc.), insulin secretion promoting drugs (e.g. sulfonylurea agents etc.), α -glucocidase inhibitors (e.g. voglibose etc.), β_3 -agonists (e.g. TAK-677 etc.), insulin preparations etc.;

10 Hypothyroidism treating drugs: dried thyroid (Thireoid), levothyroxine sodium (Thyradin S), liothyronine sodium (Thyronine, Thyronamin);

Nephrotic syndrome terating drugs: prednisolone (Predonine), prednisolone sodium succinate (Predonine), 15 methylprednisolone sodium succinate (Solu-Medrol), betamethasone (Lynderon);

Anticoagulant therapy agents: dipyridamole (Persantin), dilazep hydrochloride (Comelian) and the like;

Chronic renal failure terating drugs: diuretic [e.g., 20 furosemide (Lasix), bumetanide (Lunetoron), azosemide (Diart) etc.], ACE inhibitors [e.g. enalapril maleate (Renivace) etc.], angiotensin II receptor antagonists [e.g. candesartan cilexetil (Blopess), losartan potassium (Nulotan), valsartan (Diovan), irbesartan etc.], Ca 25 antagonists (maninhiron), α receptor blockers and the like.

In combination with these drugs, the compound (I) can be preferably orally administered.

Since hyperlipemia aggravates arterial sclerosis and causes hypertension, the compound (I) is suitable for treatment or prevention of hypertension, and in this case, the compound (I) can be administered alone or in combination with the medicaments listed below. In this case, the possible combination includes combinations with, for example, angiotensin-II antagonists [e.g., losartan potassium (Nu-Lotan), candesartan cilexetil (Blopess) and the like], ACE inhibitors [e.g., enalapril maleate (Renivace), lisinopril (Zestril, Longes), delapril hydrochloride (Adecut), captopril and the like], calcium antagonists [e.g., amlodipine besylate (Amlodin, Norvasc), manidipine hydrochloride (Calslot) and the like], hypotensive diuretic, α receptor blockers, β receptor blockers and the like.

A further notable indication of the compound (I) is osteoporosis accompanied by increase of blood cholesterol. Because of the superior lipid lowering activity, the compound (I) can be used for treatment or prevention of osteoporosis accompanied by increase of blood cholesterol, and in this case, the compound (I) can be administered alone or in combination with the medicaments listed below. The possible combination includes combinations with a sex

hormone and associated drugs [e.g., an estrogen preparation, ipriflavone (Osten), raloxifene, osaterone, tibolone and the like], a bone resorption inhibitor such as calcitonins, vitamin D preparations [e.g., alfacalcidol, calcitriol and
5 the like], bisphosphonates (e.g., etidronate, clodronate and the like) and the like, a bone formation-accelerating agent such as fluorine compound, PTH and the like.

Further possible application of the compound (I) is use for suppression of thrombus formation. Since blood
10 triglyceride level and Factor VII that involves in blood clotting have a positive correlation, and triglyceride is decreased and clotting is suppressed by intake of ω -3 fatty acid, hypertriglyceridemia accelerates thrombus formation. Furthermore, since the VLDL of a hyperlipemia patient
15 increased secretion of a plasminogen activator inhibitor from a vascular endothelial cell more strongly than that of a person having normal blood lipid, it is also thought that triglyceride (hereinafter referred as TG) decreases the fibrinolysis ability. Therefore, in view of the TG
20 lowering activity, the compound (I) is suitable for prevention or treatment of thrombus formation. In this case, the compound can be used alone or in combination with the known therapeutic agents listed below, preferably for oral administration.

25 Thrombus formation preventing or treating drugs: blood

coagulation inhibitors [e.g., heparin sodium, heparin calcium, warfarin calcium (Warfarin) etc.], thrombolytic drugs [e.g., urokinase], antiplatelet drugs [e.g., aspirin, sulfinpyrazone (Anturan), dipyridamole (Persantin),
5 ticlopidine (Panaldine), cilostazol (Pletal), clopidogrel etc.].

In addition, the compound (I) has superior high-density lipoprotein-cholesterol level elevating activity and is low toxic. Therefore, these compounds and salts
10 thereof can be used safely as, for example, an agent for prevention or treatment of primary low or high-density lipoprotein-cholesterolemia, Tangier disease or the like, as well as an agent for prevention or treatment of cardiac infarction, atherosclerotic disease, hyperlipemia, mixed-
15 type lipid abnormality, diabetes, diabetic complication or the like and can be used for preventing or treating arteriosclerosis, hyperlipemia, hypertension, diabetes, diabetic complication, diabetic nephropathy, diabetic neuropathy, diabetic retinopathy, arrhythmia, peripheral
20 vascular disease, thrombosis, pancreatic disorder, ischemic cardiac disease, brain ischemia, sequela of cardiac infarction, heart failure, cardiac valvular disease or Alzheimer's disease, in a mammal (e.g., mouse, rat, hamster, rabbit, cat, dog, cattle, horse, sheep, monkey, human and
25 the like). In addition, the compound (I) is suitable for

treating and preventing hypoHDLemia (including primary hypoHDLemia), Tangier disease, and ischemic heart disease that is developed frequently in a diabetic patient after menopause. In addition, the compound (I) is particularly
5 suitable for treating and preventing hyperlipemia, in particular, hypertriglyceridemia, hyperlipoproteinemia and hypercholesterolemia, as well as atherosclerosis vascular lesion arising therefrom and the secondary diseases thereof such as coronary artery disease, cerebral ischemia,
10 aneurysm, cerebral arteriosclerosis, peripheral arteriosclerosis, intermittent claudication, gangrene and the like

As a further notable example for application of the compound (I), prevention or treatment of Alzheimer's
15 disease is exemplified. It has been known that increase of blood cholesterol is a risk factor of Alzheimer's disease. The compound (I) can be used for prevention or treatment of Alzheimer's disease due to its superior high density lipoprotein-cholesterol level elevating activity and lipid
20 lowering activity, and when the compound (I) is used for such purpose, it can be administered alone or in combination with the following drugs. In this case, the possible combination includes combinations with an acetylcholinesterase inhibitor (e.g., Aricept, Exelon and
25 the like), an amyloid β -production or secretion inhibitor

(e.g., a γ or β secretase inhibitor such as JT-52, LY-374973 and the like, or SIB-1848 and the like), an amyloid β coagulation inhibitor (e.g., PTI-00703, BETABLOC (AN-1792) and the like) and the like.

5 In addition, since the compound (I) has blood glucose lowering activity and shows blood glucose lowering activity in a rat suffering from endomorphic diabetes, it improves insulin resistance. It is, in view of its biological characteristics, especially suitable for prevention or
10 treatment of hyperglycemia and the secondary disease arising therefrom such as complications observed in the diabetic nephropathy and renal failure stage, circulatory disease such as anaemia, bone metabolism abnormality, vomiting, nausea, anorexia and diarrhea, nervous symptoms
15 such as neuropathy, diabetic neuropathy, diabetic retinopathy, diabetic vascular disorder, as well as insulin resistance and diseases arising therefrom such as hypertension and impaired glucose tolerance and the secondary disease such as cardiac disease, cardiac failure,
20 ischemic cardiac disease, cerebral ischemia, intermittent claudication and gangrene.

 In treatment of these diseases, the high-density lipoprotein-cholesterol level elevating agent of the present invention may be used alone for prevention or
25 treatment, or may be used in combination with other blood

glucose lowering drugs or hypotensive drugs. In this case, these compounds are preferably administered as oral preparations (including intraoral disintegrating tablets). Alternatively, if necessary, the compounds may be administered as rectal preparations in the form of suppository. The ingredients that can be combined in this case include (1) an insulin preparation (e.g., human insulin and the like), (2) a sulfonylurea agent (e.g., glibenclamide, gliclazide, glimepiride and the like), (3) an α -glucosidase inhibitor (e.g., voglibose, acarbose and the like), (4) an insulin sensitizer (e.g., pioglitazone, rosiglitazone and the like), (5) an aldose reductase inhibitor (e.g., Epalrestat, Torestat and the like), and a glycation inhibitor (e.g., aminoguanidine and the like).

A combination with a gynecologic disease treating drug (a climacteric disorder treating drug (conjugated estrogen, estradiol, testosterone enanthate, estradiol valerate and the like), a breast cancer treating drug (tamoxifen citrate and the like), a endometriosis and hysteromyoma treating drug (leuprorelin acetate, danazol and the like) or the like, or a combination with such a drug and a diabetes treating drug is also possible.

Furthermore, a combination with a hypotensive agent is possible, and the agent includes, for example, (1) a diuretic (e.g., furosemide, spironolactone and the like),

(2) a sympathetic nerve inhibitor (e.g., atenolol and the like), (3) an angiotensin II receptor antagonist (e.g., losartan, candesartan cilexetil, valsartan, irbesartan, olmesartan and the like), (4) an angiotensin I converting enzyme inhibitor (e.g., enalapril maleate, delapril hydrochloride and the like), (5) a calcium antagonist (e.g., nifedipine, manidipine hydrochloride, amlodipine besylate and the like) and the like.

In addition, a combination with a chronic cardiac failure treating drug is possible, and the drug includes, for example, (1) a β receptor blocker, (2) an ACE inhibitor [e.g. enalapril maleate (renivace), lisinopril (longes, zestril etc.)], (3) an angiotensin II receptor antagonist [e.g. candesartan cilexetil (blopress), valsartan, losartan etc.], (4) an aldosterone antagonist (spironolactone, eplerenone), (5) an endothelin antagonist, (6) a Na-H exchange inhibitor, (7) a Na-Ca exchange inhibitor, (8) a MCC-135 and the like.

The compound (I) has superior skeletal muscle protecting activity. That is, the compound (I) exhibits treating of preventing effect against condition in which skeletal muscle is necrosed or colliquated, caused by various factors such as ischemia, effort, excessive exercise, trauma (bruise, skeletal muscle bleeding, electric shock), burn, malignant hyperthermia, malignant

syndrome, metabolic myopathy, inflammatory myopathy, muscular dystrophy, infection, intoxication, metabolism abnormality and hyperthermia. More specifically, the compound (I) protects skeletal muscle from cell disorder
5 resulting from the above factors. In addition, the compound (I) has treating or preventing effect against myalgia resulting from cytotoxicity of other drugs (e.g. HMG-CoA reductase inhibitors, cyclosporin, fibrate drugs etc.) and further, rhabdomyolysis in a serious case, etc..

10 In particular, the compound (I) exhibits superior treating or preventing effect against myalgia induced by a HMG-CoA reductase inhibitor and further, serious rhabdomyolysis, and inhibits decrease of geranylgeranylpyrophosphate in a muscular cell induced by a
15 HMG-CoA reductase inhibitor (e.g. atorvastatin, lovastatin, simvastatin, pravastatin, rosuvastatin, itavastatin, fluvastatin, cerivastatin, pitavastatin etc.).

The compound (I) has superior skeletal muscle protecting activity and is low toxic. Therefore, the agent
20 of the present invention can be safely used, for example, as an agent for preventing or treating rhabdomyolysis, myoglobinuria associated with rhabdomyolysis, or myalgia, in a mammal (e.g. mouse, rat, hamster, rabbit, cat, dog, cow, horse, sheep, monkey, human etc.).

25 The compound (I) has superior ubiquinone increasing

activity, and preventing or treating effect against and inhibiting effect of progression of organ dysfunction and organ failure, and thus, is useful as an agent for preventing or treating and for inhibiting progression of diseases based on this pharmacological activity. Herein, organ dysfunction includes hypofunction of various organs and complications thereof and, inter alia, preferred is ischemic organ dysfunction. That is, the compound of the present invention can prevent cell death caused by ischemia or the like and can protect the function of a cell and an organ, and thus, it can be also used as an agent for maintaining the function of an organ, an agent for protecting an organ, an inhibitor of organ cell death, or the like. Specifically, the compound of the present invention can prevent or treat heart hypofunction (including damage of cardiac muscle), brain hypofunction and pancreatic hypofunction resulting from various factors (in particular, based on ischemia) and the failure of each organ and can inhibit progress to death.

In addition, organ dysfunction may be organ dysfunction resulting from diseases such as arteriosclerotic diseases (cardiac infarction, angina pectoris, brain infarction, cerebral hemorrhage etc.) including ischemic cardiac disease, or may be organ dysfunction occurring during or after an operation or

transplantation of an organ. Further, the agent of the present invention is also useful for inhibiting progression, improving prognosis, and preventing secondary development and recurrence of diseases (in particular, ischemic disease
5 such as ischemic cardiac disease or brain infarction) which are causes of the aforementioned organ dysfunctions.

Herein, the organ includes, for example, brain, liver, kidney, heart, spleen, pancreas, eye (retina), and nervous tissue (central nervous tissue, peripheral nervous tissue
10 etc.); preferably, peripheral nervous tissue and, inter alia, preferred are heart and nervous tissue.

Having both of squalene synthase inhibitory activity and ubiquinone increasing activity allows application of the agent to the prognosis of ischemic disease or the like
15 in brain, heart, kidney, nervous tissue, pancreas or the like. For example, in the case of a brain (nervous tissue), inhibiting the progress to a coma, maintaining consciousness or life-prolonging becomes possible, and Parkinson's disease or Alzheimer's disease resulting from
20 central neurodegenerative disease can be treated. In addition, treatment of numbness of hands and feet, imperception, pain, thermal sensitivity abnormality, ulcer, or nervous hyporeflexia resulting from peripheral neuropathy becomes possible. In the case of a heart,
25 treatment of cardiac failure or arrhythmia, or life-

prolonging becomes possible. In the case of kidneys, inhibiting the progress to dialysis or renal transplantation, or life-prolonging becomes possible.

The compound of the present invention has superior
5 ubiquinone increasing activity and preventing or treating
effect against organ dysfunction or organ failure, and is
low toxic. Therefore, the compound of the present
invention can be safely used as an agent for preventing or
treating cardiac infarction, arteriosclerotic diseases,
10 hyperlipemia, brain infarction, cerebral hemorrhage,
neurodegenerative disease or diabetes, or diabetic
complications, in addition to an agent for preventing or
treating and an agent for inhibiting progression of organ
dysfunction or organ failure.

15 The compound (I) can be used for treating or
preventing arteriosclerosis, hyperlipemia, mixed-type lipid
abnormality, diabetes, diabetic complications, diabetic
nephropathy, diabetic neuropathy, diabetic retinopathy,
arrhythmia, peripheral vascular disease, thrombosis,
20 pancreatic disorder, ischemic heart disease, CHD (coronary
heart diseases), cerebral ischemia, cardiac infarction, the
sequelae of cardiac infarction, heart valvular disease, or
Alzheimer's disease. In addition, the compound (I) can be
used for preventing or treating cerebral infarction;
25 cerebral hemorrhage; pollakiuria, urinary incontinence or

deteriorated excretion of urinary bladder based on neuropathy; Parkinson's disease based on neurodegenerative disease; and cerebral vascular dementia, in addition to cardiac failure and renal failure. The compound (I) is also useful for inhibiting death caused by these diseases or life-prolonging.

Furthermore, ubiquinone has been reported to activate the UCP (uncoupling protein) function. Therefore, the compound (I) is useful for preventing or treating obesity and is suitable for preventing or treating impaired glucose tolerance, diabetes, insulin resistance, hypertension, hyperlipemia or the like associated with obesity.

Since the compound (I) has both of squalene synthase inhibiting activity and ubiquinone increasing activity in addition to lipid metabolism improving activity such as cholesterol lowering activity, triglyceride lowering activity and high-density lipoprotein-cholesterol (HDL) level elevating activity, it can be extremely advantageously used for preventing or treating organ dysfunction or organ failure, inter alia, organ dysfunction or organ failure resulting from diseases such as arteriosclerotic disease (cardiac infarction, angina pectoris, cerebral infarction, cerebral hemorrhage etc.) including ischemic cardiac disease. In addition, since the compound (I) has ubiquinone increasing activity in addition

to lipid lowering activity, for example, it can treat ischemic cardiac disease, prevent or treat more serious cardiac failure, and inhibit progress from cardiac failure to death, and thus it is extremely useful as compared with
5 a lipid lowering agent having no ubiquinone increasing activity. In addition, regarding other organs such as brain, kidney and nervous tissue, the compound (I) having ubiquinone increasing activity in addition to lipid lowering activity is excellent in terms of being capable of
10 preventing or treating organ or tissue failure in addition to organ dysfunction, and also has life-prolonging effect.

When the compound (I) is applied to the aforementioned various diseases, it can be used in combination with biologics (e.g. antibodies, vaccine preparations, etc.).

15 Alternatively, the compound (I) can be applied as a combination therapy in combination with genetic therapy. The antibodies and vaccine preparations include vaccine preparations directed to angiotensin II, vaccine preparations directed to CETP, CETP antibodies, TNF α
20 antibodies and antibodies directed to other cytokine, amyloid β vaccine preparations, and 1-type diabetes vaccines (DIAPEP-277 of Peptor Company, etc.), as well as antibodies or vaccine preparations directed to cytokine, renin-angiotensin enzymes and the products thereof,
25 antibodies or vaccine preparations directed to enzymes or

proteins involved in blood lipid metabolism, antibodies or vaccines relating to enzymes or proteins involved in coagulation or fibrinogenolysis system in blood, and antibodies or vaccine preparations directed to proteins involved in glucose metabolism or insulin resistance. The genetic therapy includes therapies using genes associated with cytokine, renin-angiotensin enzymes and the products thereof, therapies using DNA decoy such as NF κ B decoy, therapies using antisense, therapies using genes associated with enzymes or a proteins involved in blood lipid metabolism (e.g. genes associated with metabolism, excretion or absorption of cholesterol, triglyceride, HDL-cholesterol or blood phospholipid), therapies using genes associated with enzymes or proteins (e.g. growth factors such as HGF, VEGF etc.) involved in vascularization therapy for peripheral vascular obstruction, therapies using genes associated with proteins involved in glucose metabolism or insulin resistance, and antisense for cytokine such as TNF. Alternatively, the compound (I) can be used in combination with various organs regeneration method such as heart regeneration, kidney regeneration, pancreas regeneration or revascularization, or vascularization therapy utilizing transplantation of marrow cells (marrow mononuclear cell, marrow stem cell etc.).

When the compound (I) is combined with other drugs

upon application to the aforementioned respective diseases, these active ingredients may be administered as a combined agent obtained by formulating them in one preparation.

The compound (I) can be used orally or parenterally
5 via injection, infusion, inhalation, rectal administration or local administration, and can be used as it is or as a pharmaceutical composition (e.g. powders, granules, tablets, pills, capsules, injections, syrups, emulsions, elixirs, suspensions, solutions etc.). That is, at least one
10 compound (I) can be used alone or as a mixture of a pharmaceutically acceptable carrier (adjuvant, excipient, additive and/or diluent).

For the medicine of the present invention, the compound (I) which is the active ingredient may be
15 administered as bulk powder, but usually, is administered in a form prepared by a conventional method appropriately using an appropriate amount of a conventional pharmaceutical carrier, for example, an excipient (e.g. calcium carbonate, kaolin, sodium hydrogen carbonate,
20 lactose, starch, crystalline cellulose, talc, granulated sugar, porous substances etc.), a binder (e.g. dextrin, gums, alcoholated starch, gelatin, hydroxypropylcellulose, hydroxypropylmethylcellulose, pullulan etc.), a disintegrant (e.g. carboxymethylcellulose potassium,
25 croscarmellose sodium, crospovidone, low-substituted

hydroxypropylcellulose, partially α -starch etc.), a lubricant (e.g. magnesium stearate, calcium stearate, talc, starch, sodium benzoate etc.), a coloring agent (e.g. tar dye, caramel, iron sesquioxide, titanium dioxide, riboflavins), a corrigent (e.g. sweetener, flavor etc.), a stabilizer (e.g. sodium sulfite etc.) and a preservative (e.g. parabens, sorbic acid etc.). The medicine of the invention including the aforementioned agent usually contains the compound (I) in an effective amount for treating and preventing disease. The content of the compound of the formula (I) in the medicine of the present invention is usually 0.1 to 100% by weight of the total preparation. The medicine used in the present invention may contain drug ingredients other than the compound (I) as an active ingredient, said ingredients are not particularly limited as long as the object of the invention is achieved, and can be used at an appropriate combination ratio. Specific examples of the dosage form include tablets (including sugar-coated tablets, film-coated tablets), pills, capsules, granules, fine granules, powders, syrups, emulsions, suspensions, injections, sustained-release injections, inhalants, and ointments. Such preparations are prepared according to a conventional method (e.g. a method described in Japanese Pharmacopoeia).

Specifically, a tablet can be produced by granulating

the compound (I) alone or a uniform mixture of the compound (I) and an excipient, a binder, a disintegrant or another suitable additive by a suitable method, followed by addition of a lubricant or the like, and then compressing the resulting granule; by compressing directly the compound (I) alone or a uniform mixture of the compound (I) and an excipient, a binder, a disintegrant or another suitable additive; or by compressing a granule prepared in advance alone or a uniform mixture of the granule and a suitable additive. The present tablet may contain a coloring agent, a corrigent or the like if necessary. The present tablet may be also coated with a suitable coating agent. An injection can be prepared by dissolving, suspending or emulsifying a certain amount of the compound (I) in water for injection, physiological saline, Ringer's solution or the like for an aqueous solvent, or in a conventional vegetable oil or the like for a non-aqueous solvent to obtain a certain amount of the resulting injection, or by putting a certain amount of the compound (I) into a container for injection and then sealing it.

A carrier for an oral preparation includes substances used conventionally in the drug preparation art such as starch, mannitol, crystalline cellulose, carboxymethylcellulose sodium, etc.. A carrier for injection includes distilled water, a physiological

saline, a glucose solution and an infusion solution. Additionally, other additives used for general preparation may be suitably added.

The medicine of the present invention can be also used
5 as a sustained-release preparation. The sustained-release preparation may be a microcapsule (e.g. microsphere microcapsule, microparticle etc.) as it is prepared by a drying-in-water method (o/w method, w/o/w method, etc.), a phase separation method, spray drying or a similar manner
10 thereto, or a preparation obtained by formulating the microcapsule or a pharmaceutical composition in sphere form, needle form, pellet form, film form or cream form, as raw material, into various dosage forms. The dosage form includes a parenteral preparation (e.g., an injection or an
15 implant for intramuscular, subcutaneous, organ, etc.; an intramucosal agent for nasal cavity, rectum, uterus, etc., etc.), and an oral preparation (e.g., hard capsule, soft capsule, granule, powder, suspension, etc.).

When the sustained-release preparation is an injection,
20 the sustained-release injection is prepared by dispersing the microcapsule in a dispersing agent (e.g., surfactants such as Tween 80, HCO-60, etc.; polysaccharides such as carboxymethylcellulose, sodium arginate, sodium hyaluronate, etc.; protamine sulfate, polyethyleneglycol, etc.),
25 preservatives (e.g., methylparaben, propylparaben, etc.),

isotonizing agents (e.g., sodium chloride, mannitol, sorbitol, glucose, etc.), local anesthetics (e.g., xylocaine hydrochloride, chlorobutanol, etc.), etc. to give an aqueous suspension, or by dispersing the microcapsule in
5 vegetable oil (e.g., sesame oil, corn oil, etc.) or a mixture thereof with phospholipids (e.g., lecithin, etc.) or middle chain fatty acid triglycerides (e.g., Miglyol 812, etc.) to give an oily suspension.

When the sustained-release preparation is a
10 microcapsule, its average particle diameter is about 0.1 to about 300 μm , preferably about 1 to about 150 μm , further preferably about 2 to about 100 μm .

When the microcapsule is formulated into a sterile preparation, there are a method comprising sterilizing the
15 whole steps of preparation, a method comprising sterilizing using gamma ray, a method comprising adding an antiseptic, etc., but the method is not specifically limited.

The medicine of the present invention can be formulated into a preparation according to a conventional
20 method. Such preparation can be usually prepared by mixing/kneading an active ingredient with an additive such as an excipient, a diluent or a carrier. The "parenteral", when used herein, includes subcutaneous injection, intravenous injection, intramuscular injection,
25 intraperitoneal injection and infusion. An injectable

preparation, for example, a sterile aqueous or oily suspension for injection may be prepared using a suitable dispersing agent or wetting agent and a suitable suspending agent by a method known in the art. The sterile injectable preparation may be a sterile injectable solution or suspension in a diluent or a solvent, which is non-toxic and can be administered parenterally, for example, an aqueous solution. An acceptable vehicle or solvent which can be used includes water, Ringer's solution, and an isotonic sodium chloride solution. A sterile involatile oil may be also usually used as a solvent or a suspending solvent. For this, any involatile oil or fatty acid can be used, including synthetic or semisynthetic fatty oil or fatty acid, and natural or synthetic or semisynthetic mono- or di- or triglycerides.

A suppository for rectal administration can be prepared by mixing the drug with an appropriate non-stimulative additive, for example, an additive which is solid at the normal temperature but is liquid at the temperature of an intestine tract, is melted in a rectum and releases a drug, such as cocoa butter or polyethylene glycol.

Examples of a solid dosage form for oral administration include the aforementioned powders, granules, tablets, pills and capsules, etc.. A preparation in such

dosage form can be prepared by mixing and/or kneading an active ingredient compound with at least one additive, for example, sucrose, lactose, cellulose sugar, mannitol (D-mannitol), maltitol, dextran, starches (e.g. corn starch),
5 microcrystalline cellulose, agar, alginates, chitins, chitosans, pectins, tragacanth gums, gums arabic, gelatins, collagens, caseins, albumin, and synthetic or semisynthetic polymers or glycerides. Such dosage forms can contain further additives as usual, and said additives include an
10 inert diluent, a lubricant such as stearic acid and magnesium stearate, a preservative such as parabens and sorbic acid, an antioxidant such as ascorbic acid, α -tocopherol and cysteine, a disintegrant (e.g. croscarmellose sodium), a binder (e.g. hydroxypropylcellulose), a
15 thickener, a buffer, a sweetener, a flavor, and a perfume. Tablets and pills may be prepared by further enteric coating. Solutions for oral administration include pharmaceutically acceptable emulsions, syrups, elixirs, suspensions and solutions. They may contain an inert
20 diluent which is conventionally used in the art, for example, water and, if necessary, additives. These oral solutions can be prepared according to a conventional method, for example, by mixing an active ingredient compound and an inert diluent and, if necessary, other
25 additives.

An oral preparation may contain, depending on the dosage form, usually about 0.01 to 99 W%, preferably about 0.1 to 90 W%, usually about 0.5 to 50% of the active ingredient compound of the present invention.

5 The dose for a particular patient is determined depending on the age, weight, general health condition, sex, diet, administration time, administration method, secretion rate, combination of drugs, and extent of symptom of a patient to be treated, or considering them and other
10 factors.

 The compound of the present invention has squalene synthase inhibitory activity, cholesterol lowering activity and triglyceride lowering activity, and has high selectivity for transition to a target organ and a wide
15 safety margin. Thus, the compound of the present invention is useful for preventing or treating hyperlipemia as a lipid lowering agent and is also useful for preventing or treating arteriosclerosis.

 A medicine containing the compound (I) of the present
20 invention is low toxic and can be safely used. The daily dose of the medicine varies depending on the condition and weight of a patient, the kind of a compound and the administration route, etc. For example, when the medicine is used as an agent for preventing or treating hyperlipemia,
25 the daily dose for an adult (body weight about 60 kg) is

about 1 to 500 mg, preferably about 10 to 200 mg of the active ingredient [the compound (I)] in the case of an oral preparation, and is about 0.1 to 100 mg, preferably about 1 to 50 mg, usually about 1 to 20 mg of the active ingredient in the case of a parenteral preparation. No toxicity is found within such a range.

The following Examples, Preparation Examples and Experimental Examples will further explain the present invention in detail, but the present invention is not limited to them.

^1H -NMR spectrum was measured by Varian Gemini 200(200MHz)-type or 300(300MHz)-type spectrometer using tetramethylsilane as an internal standard. All δ values are shown in ppm. The numerical value denoted for a mixed solvent is the mixing ratio of respective solvents based on volume unless otherwise indicated. The % means % by weight unless otherwise indicated. The ratio of elution solvents for silica gel chromatography is based on volume unless otherwise indicated. The room temperature (normal temperature), as used herein, is from about 20°C to about 30°C.

(1) Carbonyldiimidazole (10.2 g, 63.1 mmol) was added to a suspension of 2-(tert-butoxycarbonylamino)acetic acid (10 g, 57.1 mmol) in THF (100 ml) and the mixture was stirred at room temperature for 2 hours. To the reaction solution were added magnesium chloride (5.4 g, 57.1 mmol) and potassium monoethylmalonate (9.7 g, 57.1 mmol) and the mixture was stirred at 60°C for 1 hour. The mixture was filtered to remove insoluble substances. The filtrate was

diluted with ethyl acetate (200 ml), washed with 1N hydrochloric acid, an aqueous saturated sodium hydrogen carbonate solution and an aqueous saturated sodium chloride solution, dried over sodium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography [developing solvent: hexane-ethyl acetate (2:1)] to obtain ethyl 4-(tert-butoxycarbonylamino)-3-oxobutanoate (11.9 g, 48.5 mmol, 85%) as a colorless oil.

(1) Carbonyldiimidazole (9.7 g, 60 mmol) was added to
 5 a solution of monoethylsuccinic acid (7.3 g, 50 mmol) in
 THF (70 ml) and the mixture was stirred at room temperature
 for 1 hour. To the reaction solution were added magnesium
 chloride (4.8 g, 50 mmol) and potassium monoethylmalonate
 (8.5 g, 50 mmol) and the mixture was stirred at 60°C for 1
 10 hour. The mixture was filtered to remove insoluble
 substances and the filtrate was concentrated under reduced
 pressure. The residue was diluted with water, acidified
 and then extracted with ethyl acetate (70 ml) twice. The
 extracts were washed with an aqueous saturated sodium
 15 chloride solution, dried over sodium sulfate, and then
 concentrated under reduced pressure. The residue was
 purified by silica gel column chromatography [developing
 solvent: hexane-ethyl acetate (3:1)] to obtain diethyl 3-

oxohexanedioate (8.9 g, 41.2 mmol, 82%) as a colorless oil.

$^1\text{H-NMR}$ (CDCl_3) δ : 1.26 (3H, t, $J = 7.2$ Hz), 1.29 (3H, t, $J = 7.2$ Hz), 2.61 (2H, t, $J = 6.6$ Hz), 2.87 (2H, t, $J = 6.6$ Hz), 3.50 (97/100 \times 2H, s), 4.14 (2H, q, $J = 7.2$ Hz),
5 4.21 (2H, q, $J = 7.2$ Hz), 5.02 (3/100 \times 1H, s).

(2) A solution of sodium nitrite (3.3 g, 48 mmol) in water (40 ml) was added dropwise to a solution of diethyl 3-oxohexanedioate (8.7 g, 40.2 mmol) obtained in Example 5-(1) in acetic acid (20 ml) under ice-cooling. Further,
10 water (60 ml) was added and the mixture was stirred overnight. The reaction solution was extracted with ethyl acetate (50 ml) twice. The extracts were washed with an aqueous saturated sodium hydrogen carbonate solution and an aqueous saturated sodium chloride solution, dried over
15 sodium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography [developing solution: hexane-ethyl acetate (2:1)] to obtain diethyl 2-hydroxyimino-3-oxohexanedioate (9.3 g, 37.9 mmol, 94%) as a colorless oil.

20 $^1\text{H-NMR}$ (CDCl_3) δ : 1.27 (3H, t, $J = 7.4$ Hz), 1.35 (3H, t, $J = 7.4$ Hz), 2.68 (2H, t, $J = 6.6$ Hz), 3.17 (2H, t, $J = 6.6$ Hz), 4.17 (2H, q, $J = 7.4$ Hz), 4.38 (2H, q, $J = 7.4$ Hz).

(3) Zinc powder (18.7 g, 0.286 mol) was added to a solution of diethyl 2-hydroxyimino-3-oxohexanedioate (9 g, 36.7 mmol) obtained in Example 5-(2) and acetic anhydride
25

(26 g, 0.220 mol) in acetic acid (120 ml) at room temperature and the mixture was stirred for 24 hours. The mixture was filtered to remove insoluble substances and the insoluble substances were washed with ethyl acetate (50 ml).

5 The filtrate and the washing solution were combined and then concentrated under reduced pressure to obtain diethyl 2-acetylamino-3-oxohexanedioate (9.0 g, 32.9 mmol, 90%) as a colorless oil.

¹H-NMR (CDCl₃) δ: 1.25 (3H, t, J = 7.2 Hz), 1.33 (3H, t, J = 7.2 Hz), 2.08 (3H, s), 2.62-2.67 (2H, m), 2.95 (1H, dt, J = 18.6, 6.6 Hz), 3.11 (1H, dt, J = 18.6, 6.6 Hz), 4.12 (2H, q, J = 7.2 Hz), 4.29 (2H, q, J = 7.2 Hz), 5.30 (1H, d, J = 6.6 Hz), 6.68 (1H, d, J = 6.6 Hz).

(4) Diethyl 2-acetylamino-3-oxohexanedioate (8.8 g, 32.2 mmol) obtained in Example 5-(3) was added to a 4N HCl solution in ethyl acetate (90 ml) and the mixture was heated to reflux for 4 hours. The reaction solution was concentrated under reduced pressure and the residue was crystallized from ethyl acetate-ether to obtain 5-amino-4-oxopentanoic acid hydrochloride (4.4 g, 26.3 mmol, 82%) as a colorless needle crystal.

¹H-NMR (CD₃OD) δ: 2.65 (2H, t, J = 7.0 Hz), 2.81 (2H, t, J = 7.0 Hz), 4.02 (2H, s).

(5) Pivaloyl chloride (0.51 g, 4.23 mmol) was added to a solution of 2-[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-

7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]acetic acid (2 g, 3.85 mmol) and triethylamine (0.41 g, 4.04 mmol) in acetonitrile (15 ml) at 0°C and the mixture was stirred at 0°C for 30 minutes.

5 To the reaction solution at 0°C, 5-amino-4-oxopentanoic acid hydrochloride (0.77 g, 4.62 mmol) obtained in Example 5-(4) was added and a solution of triethylamine (0.58 g, 5.77 mmol) in acetonitrile (2 ml) was then added dropwise.

After stirring at room temperature for 30 minutes, the
10 reaction solution was diluted with ethyl acetate (50 ml), washed with 0.1N hydrochloric acid and an aqueous saturated sodium chloride solution, dried over sodium sulfate, and then concentrated under reduced pressure. The residue was dissolved in DMF (30 ml), potassium carbonate (0.65 g, 4.69
15 mmol) and methyl iodide (0.67 g, 4.69 mmol) were added, and the mixture was stirred at room temperature for 1 hour. The reaction solution was diluted with ethyl acetate (100 ml), washed with water, a 5% aqueous potassium hydrogen sulfate solution, an aqueous saturated sodium hydrogen
20 carbonate solution and an aqueous saturated sodium chloride solution, dried over sodium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography [developing solvent: hexane-ethyl acetate (1:3)] to obtain methyl 5-({2-[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-

2-{[(3R,5S)-7-chloro-5-(2,3-dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl)methyl}-4-methyl-1,3-thiazol-5-carboxylic acid

(1) DMF(0.01 ml) was added to a solution of 2-
[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-
dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-
3-yl]acetic acid (3 g, 6.49 mmol) and thionyl chloride (2.3
5 g, 19.5 mmol) in THF (10 ml). The reaction solution was
stirred at room temperature for 1 hour and then
concentrated under reduced pressure. The residue was
dissolved in THF (10 ml) and added dropwise to a solution
of hydrogen sulfide in pyridine (30 ml). The reaction
10 solution was stirred at 0°C for 1 hour and then diluted
with 2.5M sulfuric acid. The product was extracted with
ethyl acetate (50 ml), washed with an aqueous saturated
sodium chloride solution, dried over sodium sulfate, and
then concentrated under reduced pressure to obtain
15 [(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-
dimethoxyphenyl)-1,2,3,5-tetrahydro-2-oxo-4,1-benzoxazepin-
3-yl]thio-S-acetic acid (6.53 g) as colorless powder.

¹H-NMR (CDCl₃) δ: 0.94 (3H, s), 1.02 (3H, s), 2.03 (3H,

(1) Potassium carbonate (0.741 g) was added to a solution of ethyl-5-{[(3R,5S)-1-(3-(acetoxy)-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl}-1H-pyrazol-4-carboxylate (3.00 g) obtained in Example 39-(1) and ethyl 4-bromobutanoate (0.794 ml) in DMF (30 ml) and the mixture was stirred overnight. The reaction solution was diluted with ethyl acetate, washed with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography to obtain ethyl 3-{[(3R,5S)-1-(3-(acetoxy)-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl}-1-(4-ethoxy-4-oxobutyl)-1H-pyrazol-4-carboxylate (0.98 g) from a first eluted fraction and ethyl 5-({(3R,5S)-1-[3-(acetoxy)-2,2-dimethylpropyl]-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl)-1-(4-ethoxy-4-oxobutyl)-1H-pyrazol-4-carboxylate (1.78 g) from a second eluted fraction.

(2) To a solution of ethyl 3-{[(3R,5S)-1-(3-(acetoxy)-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl}-1-(4-ethoxy-4-oxobutyl)-1H-pyrazol-4-carboxylate (0.8 g) obtained in Example 40-(1) in ethanol (8 ml) was added a 1N

aqueous sodium hydroxide solution (4 ml) and the mixture was stirred overnight. The reaction solution was neutralized with 1N hydrochloric acid and extracted with ethyl acetate. This extract was washed with an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography to obtain the title compound (157 mg).

(1) [(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]acetic acid (10 g, 19.2 mmol) was dissolved in THF (80 ml), and N-methylmorpholine (2.2 ml, 23.1 mmol) and ethyl chlorocarbonate (2.54 ml, 23.1 mmol) were added dropwise under ice-cooling thereto. After stirring at the same temperature for 1 hour, the mixture was cooled to -30°C and sodium borohydride (2.18 g, 58.0 mmol) was added thereto. Further, MeOH (80 ml) was added dropwise gradually and the mixture was stirred for 1 hour. At the same temperature, an aqueous saturated ammonium chloride solution was added thereto and the mixture was extracted with AcOEt (480 ml). The organic layer was washed with water and an aqueous saturated sodium chloride solution, dried over anhydrous sodium sulfate, and then concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography [developing solvent: hexane-ethyl acetate (2:3)] to obtain

(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-1,2,3,5-tetrahydro-2-oxo-4,1-benzoxazepin-3-ethanol (9.3 g) as a colorless crystal.

(1) Oxalyl chloride (10 ml) was added to a solution of (2E)-4-(bromophenyl)-4-oxo-2-butenoic acid (24.5 g) in a mixture of THF (200 ml) and DMF (3 drops) and the mixture was stirred at room temperature for 1 hour. The reaction solution was concentrated under reduced pressure and the residue was dissolved in ethyl acetate (120 ml). The resulting solution was added dropwise to a mixed solvent of a solution of 3-({4-chloro-2-[(S)-(2,3-dimethoxyphenyl)(hydroxyl)methyl]phenyl}amino)-2,2-dimethyl-1-propanol (24.5 g) in ethyl acetate (300 ml) and a 1N aqueous sodium hydroxide solution (130 ml) under ice-cooling, and the mixture was stirred at 0°C for 1 hour. The organic layer was washed successively with an aqueous saturated sodium hydrogen carbonate solution and an aqueous saturated sodium chloride solution, dried over sodium sulfate, and then concentrated under reduced pressure. The resulting residue was dissolved in ethanol (240 ml), DBU (11 ml) was added, and the mixture was stirred at room temperature overnight. Water (60 ml) was added to the

reaction solution gradually and the mixture was stirred for 1 hour. Precipitated crystals were filtered and washed with a mixed solution of ethanol/water = 2/1 to obtain (3R,5S)-3-[2-(4-bromophenyl)-2-oxoethyl]-7-chloro-5-(2,3-dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-1,5-dihydro-4,1-benzoxazepin-2(3H)-one (24.5 g).

(1) Acetyl chloride (0.4 ml) was added to a solution of ethyl 3-(4-{{(3R,5S)-7-chloro-5-(2,3-dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl}acetyl}phenyl)propionate (3.0 g) obtained in Example 72-(1) in a mixture of THF (50 ml) and pyridine (0.8 ml), and the mixture was stirred at room temperature for 2 hours. Water was added to the reaction solution, followed by extraction with ethyl acetate. The resulting organic layer was washed successively with diluted hydrochloric acid, an aqueous saturated NaHCO₃ solution and water, dried over magnesium sulfate, and then concentrated under reduced pressure to obtain ethyl 3-(4-{{(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl}acetyl}phenyl)propionate (2.7 g) as an oil.

¹H-NMR (CDCl₃) δ: 0.94 (3H, s), 1.02 (3H, s), 1.26 (3H, t, J = 7.2 Hz), 2.04 (3H, s), 2.62 (2H, t, J = 7.8 Hz), 2.99 (2H, t, J = 7.8 Hz), 3.30 (1H, dd, J = 4.8, 17.4 Hz), 3.60 (1H, m), 3.61 (3H, s), 3.76 (2H, m), 3.89 (3H, s),

5 (2) Sodium borohydride (40 mg) and methanol (2 ml) were successively added to a solution of ethyl 3-(4-{[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]acetyl}phenyl)propionate (0.2 g) obtained in Example
10 81-(1) in THF (5 ml) and the mixture was stirred at room temperature for 30 minutes. After 1N hydrochloric acid was added, the reaction solution was extracted with ethyl acetate. The resulting organic layer was washed
15 successively with diluted hydrochloric acid and water, dried over magnesium sulfate, and then concentrated under reduced pressure. After the resulting residue was dissolved in THF (5 ml) and ethanol (5 ml), a 2N aqueous sodium hydroxide solution (2.5 ml) was added thereto and the mixture was stirred at room temperature for 2 hours.
20 The reaction solution was acidified with diluted hydrochloric acid and then extracted with ethyl acetate. The organic layer was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure to obtain 3-(4-{2-[(3R,5S)-7-chloro-5-(2,3-
25 dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-2-oxo-

Thionyl chloride (0.2 ml) was added to a solution of ethyl 3-(4-{[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]acetyl}phenyl)propionate (1.2 g) obtained in Example 81-(1) in a mixture of dichloromethane

(30 ml) and pyridine (0.5 ml), and the mixture was stirred at room temperature for 1 hour. After diluted hydrochloric acid was added, the reaction solution was extracted with dichloromethane. The organic layer was washed successively
5 with diluted hydrochloric acid, an aqueous saturated NaHCO_3 solution and water, dried over magnesium sulfate, and then concentrated under reduced pressure. The resulting residue was dissolved in acetic acid (10 ml), a zinc powder (2.5 g) was added thereto, and the mixture was stirred at room
10 temperature for 2 hours. The reaction mixture was filtered with Celite and the filtrate was concentrated under reduced pressure. An aqueous saturated NaHCO_3 solution was added to the resulting residue and the mixture was extracted with ethyl acetate. The organic layer was washed with water,
15 dried over magnesium sulfate, and then concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography. The resulting oil was dissolved in THF (10 ml) and ethanol (10 ml), a 2N aqueous NaOH solution (5.0 ml) was added thereto, and the mixture
20 was stirred at room temperature for 2 hours. The reaction solution was acidified with diluted hydrochloric acid and then extracted with ethyl acetate. The organic layer was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure to obtain 3-(4-{2-

Palladium acetate (655 mg), 1,1'-

15 bis(diphenylphosphino)ferrocene (1.6 g) and triethylamine (4.0 ml) were added to a solution of (3R,5S)-3-[2-(4-bromophenyl)-2-oxoethyl]-7-chloro-5-(2,3-dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-1,5-dihydro-4,1-benzoxazepin-2-(3H)-one (6.0 g) obtained in Example 71-(1)
 20 in a mixture of DMF (60 ml) and methanol (30 ml), and the

mixture was heated at 60°C for 20 hours under carbon monoxide atmosphere. After 1N hydrochloric acid was added, the reaction solution was extracted with ethyl acetate. The extract was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography and the resulting oil was dissolved in a mixture of THF (100 ml) and ethanol (100 ml). Ethyl 4-[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]-3-oxobutanoate (1.2 g) was dissolved
 5 in toluene (5 ml), and DBU (0.3 ml) was then added thereto. After a 40% aqueous chloroacetoaldehyde solution (0.4 ml) was then added under ice-cooling, the mixture was stirred at room temperature for 1 hour. After water was added, the reaction solution was extracted with toluene. The
 10 resulting organic layer was concentrated under reduced pressure. The resulting residue was dissolved in toluene (20 ml), a catalytic amount of p-toluenesulfonic acid was added, and the mixture was heated at 100°C for 2 hours. The reaction solution was concentrated and then purified by
 15 silica gel column. The resulting residue was dissolved in a mixture of THF (5 ml) and methanol (20 ml), a 2N aqueous NaOH solution (5 ml) was added, and the mixture was stirred at room temperature overnight. The reaction solution was acidified with diluted hydrochloric acid and then extracted

with ethyl acetate. The organic layer was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure to obtain 2-{[(3R,5S)-7-chloro-5-(2,3-dimethoxyphenyl)-1-(3-hydroxy-2,2-dimethylpropyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl}-3-furancarboxylic acid (26 mg).

The reaction solution was diluted with ethyl acetate, washed with 1N aqueous hydrochloric acid, an aqueous saturated sodium chloride solution, dried over anhydrous magnesium sulfate, and then concentrated under reduced pressure. The residue was dissolved in methanol (150 ml), a 1N aqueous sodium hydroxide solution (52 ml) was added, and the mixture was stirred for 2 hours. The reaction solution was concentrated under reduced pressure, and the residue was dissolved in water and washed with ether. The aqueous layer was acidified with 1N aqueous hydrochloric acid and then extracted with ethyl acetate. The organic layer was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was dissolved in methylene chloride (100 ml), pyridine (6.46 ml, 80 mmol) and acetyl chloride (4.98 ml, 70 mmol) were added thereto, and the mixture was stirred for 1 hour. After

water (50 ml) was added, the reaction solution was stirred for 4 hours and then extracted with ethyl acetate. The organic layer was washed with an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography to obtain 4-[(3R,5S)-1-[3-acetoxy-2,2-dimethylpropyl]-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]butanoic acid (10.9 g, 19.8 mmol, 76%).

obtained in Example 123-(2) was dissolved in ethanol (10 ml). Thereto ethyl 4-chloro-3-oxobutanoate (0.243 ml, 1.8 mmol) was added and the mixture was stirred at 90°C for 2 hours. After the reaction solution was cooled to room temperature, a 1N aqueous sodium hydroxide solution (5 ml) was added thereto and the mixture was stirred for 5 hours. The aqueous layer was acidified with a 5% aqueous potassium hydrogen sulfate and then extracted with ethyl acetate. The organic layer was washed with water, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography to obtain the title compound (0.3 g, 0.498 mmol, 50%).

(1) Ethyl 3-mercaptopropionate (0.28 ml, 2.2 mmol) and potassium carbonate (0.21 g, 1.5 mmol) were added to a

solution of (3R,5S)-7-chloro-3-[(5-chloro-1,2,4-thiadiazol-3-yl)methyl]-5-(2,3-dimethoxyphenyl)-1-(2,2-dimethylpropyl)-1,5-dihydro-4,1-benzoxazepin-2(3H)-one (0.54 g, 1.0 mmol) obtained in Example 150-(1) in THF (10 ml), and the mixture was stirred at 45°C for 13.5 hours. The reaction solution was extracted with ethyl acetate, washed successively with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was dissolved in ethanol, a 2N aqueous sodium hydroxide solution (0.836 ml, 1.67 mmol) was added, and the mixture was stirred for 1 hour. The reaction solution was extracted with ethyl acetate, washed successively with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. To the residue was added ethyl 2-bromo-2-methylpropionate (0.18 ml, 1.25 mmol), potassium carbonate (0.17 g, 1.25 mmol) and THF (10 ml), and the mixture was heated to reflux for 14 hours. The reaction solution was extracted with ethyl acetate, washed successively with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography [developing solvent: hexane-ethyl acetate (85:15-80:20)] to obtain

ethyl 2-[(3-{[(3R,5S)-7-chloro-5-(2,3-dimethoxyphenyl)-1-(2,2-dimethylpropyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]methyl}-1,2,4-thiadiazol-5-yl)thio]-2-methylpropionate (0.47 g, 87%).

2.5 hours. The reaction solution was diluted with ethyl acetate, and the organic layer was washed with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate and then concentrated under reduced pressure to obtain 3-[(3R,5S)-3-[(3Z)-3-amino-2-[[tert-butyl(dimethyl)silyl]oxy}-3-(hydroxyimino)propyl]-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-2,3-dihydro-4,1-benzoxazepin-1(5H)-yl]-2,2-dimethylpropyl acetate as crude powder (4.07 g, 100%).

(2) Triethylamine (0.63 ml, 4.49 mmol) and ethyl 4-chloro-4-oxobutanoate (0.47 ml, 3.29 mmol) were added dropwise to a solution of 3-[(3R,5S)-3-[(3Z)-3-amino-2-[[tert-butyl(dimethyl)silyl]oxy}-3-(hydroxyimino)propyl]-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-2,3-dihydro-4,1-benzoxazepin-1(5H)-yl]-2,2-dimethylpropyl acetate (2.03 g, 2.99 mmol) obtained in Example 159-(1) in THF (20 ml) under ice-cooling, and the mixture was stirred at room temperature for 4.5 hours. The reaction solution was concentrated under reduced pressure, water (20 ml) was added to the residue, and the mixture was heated to reflux for 17.5 hours. After the reaction solution was diluted with ethyl acetate, the organic layer was washed with water and an aqueous saturated chloride solution, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column

chromatography to obtain ethyl 3-[3-(2-[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]-1-[[tert-butyl(dimethyl)silyl]oxy}ethyl)-1,2,4-oxadiazol-5-yl]propionate (1.65 g, 70%).

(3) A boron trifluoride-diethyl ether complex (0.53 ml, 4.19 mmol) was added to a solution of ethyl 3-[3-(2-[(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]-1-[[tert-butyl(dimethyl)silyl]oxy}ethyl)-1,2,4-oxadiazol-5-yl]propionate (1.65 g, 2.09 mmol) obtained in Example 159-(2) in acetonitrile (20 ml) under ice-cooling, and the mixture was stirred for 1 hour under ice-cooling. The reaction solution was diluted with ethyl acetate, and the organic layer was washed with water and an aqueous saturated sodium chloride solution, dried over magnesium

sulfate and then concentrated under reduced pressure. To a solution of the residue in dichloromethane (15 ml), triethylamine (0.87 ml, 6.23 mmol) was added and a solution of a sulfur trioxide-pyridine complex (0.83 g, 5.19 mmol) in DMSO (3.3 ml) that was prepared previously was then added dropwise. The mixture was stirred for 20 hours. The reaction solution was diluted with ethyl acetate, and the organic layer was washed with water and an aqueous saturated sodium chloride solution, dried over magnesium sulfate and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography to obtain ethyl 3-(3-([(3R,5S)-1-(3-acetoxy-2,2-dimethylpropyl)-7-chloro-5-(2,3-dimethoxyphenyl)-2-oxo-1,2,3,5-tetrahydro-4,1-benzoxazepin-3-yl]acetyl)-1,2,4-oxadiazol-5-yl)propionate (1.05 g, 75%) as crude powder.

Experimental Example 1

Squalene synthase inhibitory activity

Measuring method

Squalene synthase inhibitory activity was measured using an enzyme solution obtained according to the following preparation method.

25

That is, an enzyme solution (protein 0.8 μg) prepared according to the following preparation method was added to a solution (total amount 50 μl) containing 5 μM [1-3H] farnesyl pyrophosphate (specific activity 25 $\mu\text{Ci/mole}$), 1mM NADPH (reduced-type nicotinamide adenine dinucleotide phosphate), 5mM MgCl_2 , 6mM glutathione, 100mM potassium phosphate buffer (pH7.4) and a test drug (added as an aqueous solution or a DMSO solution) and reacted at 37°C for 45 minutes. After stopping the reaction by addition of 150 μl of chloroform/methanol (1:2) mixed solution, 50 μl of chloroform and 50 μl of a 3N sodium hydroxide solution were added. Then, 50 μl of the chloroform layer (lower layer) containing the reaction product whose main component was squalene was mixed with 3 ml of a toluene-based liquid scintillator and its radioactivity was measured with a liquid scintillation counter.

Squalene synthase inhibitory activity was expressed as the concentration of a test drug required to inhibit 50% of radioactivity incorporated into the chloroform layer (IC_{50} , molar concentration (M)). All compounds described in Examples exhibited potent squalene synthesis inhibitory activity having IC_{50} of 1 μM or lower.

Preparation of a human enzyme solution

Human liver cancer cell HepG2 (about 1×10^9 cells)

obtained by culturing in Dulbecco's modified Eagle medium containing 10% bovine fetal serum (37°C in the presence of 5%CO₂) was suspended in 10 ml of an ice-cooled buffer [100mM potassium phosphate buffer (pH7.4), 30mM nicotinamide, 2.5mM MgCl₂], disrupted by sonication (30 seconds, twice) and then centrifuged at 10000 x g for 20 minutes (4°C). The resulting supernatant was further centrifuged at 105000 x g for 90 minutes (4°C). The precipitate was suspended in an ice-cooled 100mM potassium phosphate buffer (pH7.4) and then centrifuged at 105000 x g for 90 minutes (4°C). The precipitate was suspended in an ice-cooled 100mM potassium phosphate buffer (pH7.4) (protein concentration about 4 mg/ml). This suspension was used as an enzyme solution.

As seen from the above results, the compound of the present invention has superior squalene synthase inhibitory activity.

Industrial Applicability

Since the compound of the present invention has squalene synthase inhibitory activity, cholesterol lowering activity and triglyceride lowering activity and has high selectivity for transition to a target organ and a wide safety margin, it is useful as an agent for preventing or treating hyperlipemia as a lipid lowering agent and is also

useful for preventing or treating arteriosclerosis.
